littleleaf

A CONNECTED PEDIATRIC CARE EXPERIENCE

One clinic. One connected care journey.

Product capabilities & development roadmap

Prepared for Dr. Ruchi Lamyan

Private clinic at ATS Nobility, Greater Noida

WORKING DEMONSTRATION

FUTURE FEATURES CLEARLY MARKED

A familiar doctor. A clearer follow-up experience.

A branded website and secure parent and doctor portals, designed to keep appointments, child profiles and clinician-published records connected.

01
Discover
Clinic identity and services

→

02
Book
Published appointment slots

→

03
Follow through
Notes and vaccine records

Current scope: a single-clinic MVP using fictional records. Proposed features in this brief are not yet delivered. Littleleaf is a working brand for discussion.

AVAILABLE TODAY

What the product can do now

The current version demonstrates the core workflow for a pediatric practice, with separate experiences for parents and the doctor.

01 / WEBSITE

A branded clinic presence

Doctor profile, services, clinic location and a responsive layout. Introductory English/Hindi content is available; the portal is currently in English.

02 / PARENT

A family care space

Sign in, view child profiles and allergies, book available visits, cancel eligible appointments, and read the doctor's published care notes.

03 / DOCTOR

A clinic workspace

View and filter appointments, review child records, publish availability, check patients in, complete visits, and publish follow-up notes.

04 / RECORDS

Continuity between visits

Keep child-specific notes and manually entered vaccination plans together. Record administration dates and view a structured pre-visit brief.

Access designed for a controlled demonstration

The homepage is reachable without ChatGPT login. The hosted portal requires owner-supplied parent or doctor test credentials. Public registration and one-click demo access are disabled.

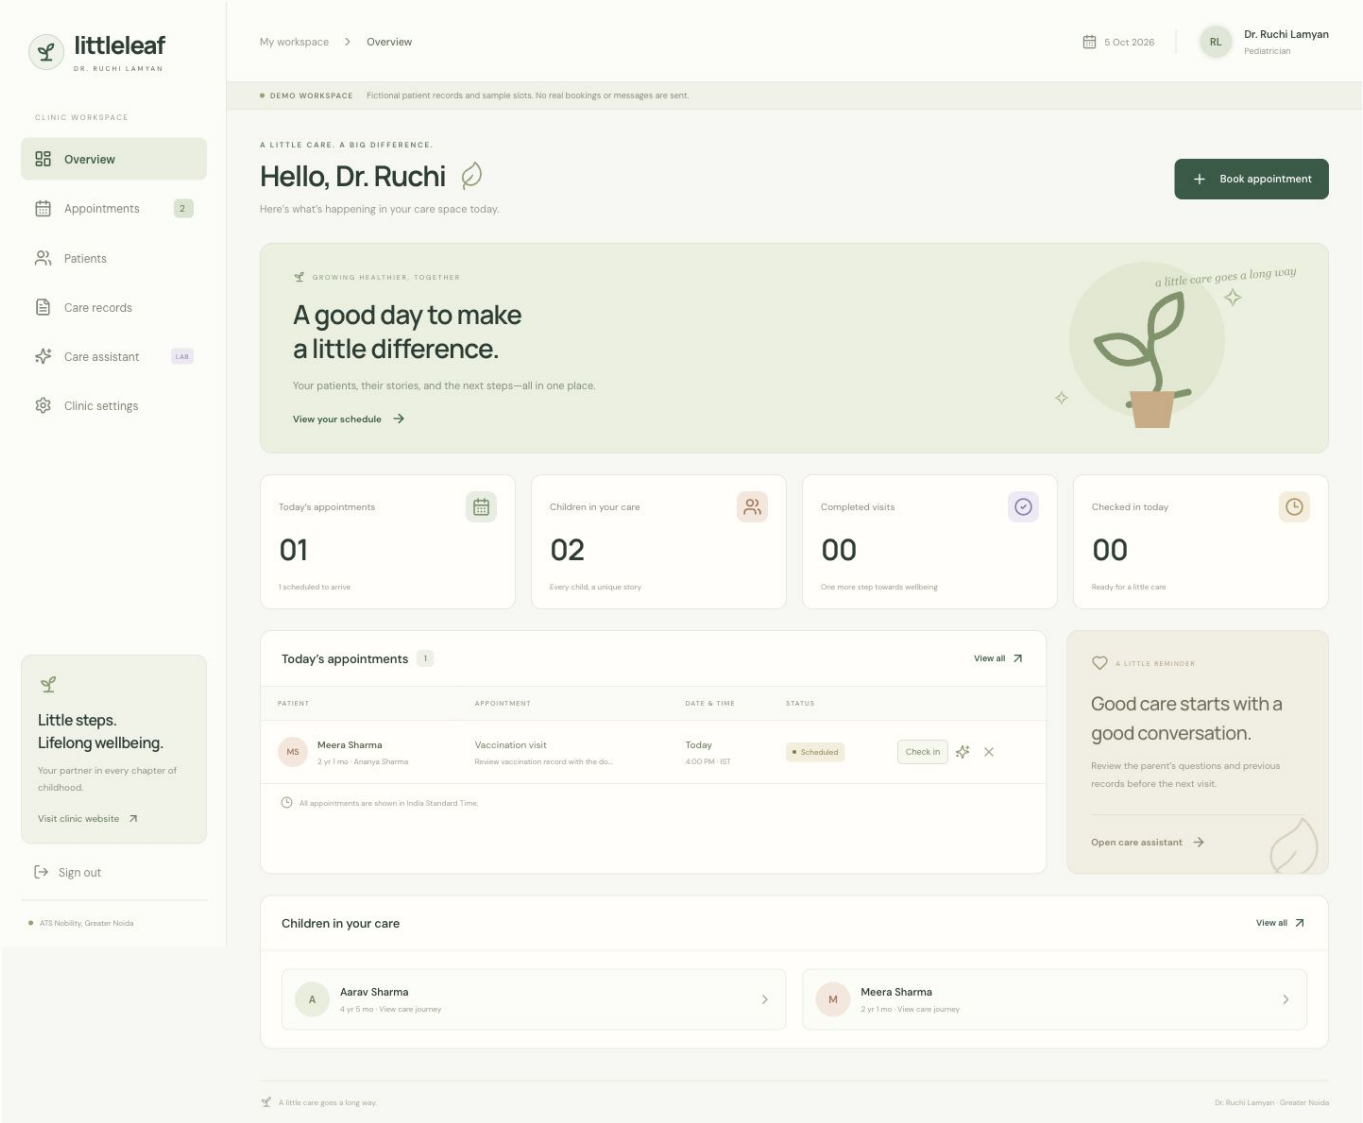

Important distinctions

- Vaccination plans are entered by the doctor; no automatic vaccine schedule is generated.
- The pre-visit brief formats existing records. It is not AI-generated and makes no clinical inference.
- Payments, messaging, prescriptions, teleconsultation and native mobile apps are not included yet.

SEE THE WORKFLOW

From booking to follow-up

An actual doctor dashboard from the development demonstration, followed by the intended everyday sequence.

Product screenshot: doctor workspace, captured 5 October 2026. All displayed patients and counts are fictional demonstration data.

01

Parent books

Select child, date, slot and visit reason.

→

02

Doctor reviews

Check in, review records and complete visit.

→

03

Parent follows up

Read the doctor's note and vaccine plan.

PRIORITY 1 / BEFORE REAL USE

Make the clinic pilot ready

The next milestone should be a reliable, approved single-clinic pilot. These additions are prerequisites for real patient use, not optional visual polish.

01

Confirm how the clinic operates

- Approve the practice identity, registration details, contact information, hours and consultation fees.
- Set visit duration, leave dates, rescheduling rules, cancellation policy and same-day booking limits.

02

Strengthen access and record handling

- Add individual staff accounts, verified parent contact details, password recovery and staff multi-factor authentication.
- Define guardian authority, adolescent access, consent, record retention, export and deletion workflows with appropriate review.

03

Prepare dependable operations

- Use a fresh production environment; remove shared demo accounts and establish onboarding and support ownership.
- Add monitored backups and tested restoration, error monitoring, recovery procedures and a security review.

Decision gate: approve the pilot before inviting families

Agree the clinical workflow, access rules and support process; verify recovery and account protection. This demo is not a production-readiness or compliance certification.

PRIORITY 2 / PEDIATRIC CARE

Extend the care experience

Proposed features to prioritize with Dr. Ruchi after the pilot foundations are approved. Scope and sequence should follow clinic needs.

01

Appointments & reception

Rescheduling, waiting list, schedule exceptions, reception access and visit queue.

Intended value: Less manual coordination around daily visits.

02

Reminders & communication

Consented appointment/follow-up reminders, delivery status and clinic-controlled messaging.

Intended value: Keep families informed between visits.

03

Pediatric longitudinal record

Growth measurements/charts, birth and development history, attachments and past reports.

Intended value: Bring relevant child history into one view.

04

Vaccination follow-through

Clinician-approved schedule rules, due/overdue views, catch-up review and reminder workflows.

Intended value: Support tracking while preserving clinical judgement.

05

Clinical documents & payments

Clinician-approved prescriptions and visit summaries; payment/UPI integration, receipts and refunds.

Intended value: Complete more of the visit journey in one place.

Additional options: parent education in Hindi and English, feedback collection, and teleconsultation after defining suitability, consent and clinic processes. No delivery dates or cost estimates are committed in this brief.

PRIORITY 3 / ASSISTED CARE & SCALE

AI with the doctor in control

The current assistant is a structured record summary. Any future AI capability should assist documentation and navigation, with explicit review before clinical content reaches families.

CURRENT

Structured pre-visit brief

Displays recorded patient details, the visit, the parent-reported concern and allergies. No external AI model is called, and no diagnosis or treatment is generated.

PROPOSED

Clinician-reviewed assistance

Draft visit summaries, organize longitudinal notes, extract report fields for verification, and help draft parent-friendly explanations in approved languages.

01
Retrieve
Only authorized, relevant records.

→

02
Draft
Flag uncertainty and show sources.

→

03
Review
Doctor edits and approves.

→

04
Publish
Record the approved output.

Before introducing AI

- Choose suitable data handling terms and permissions; control what information leaves the system.
- Evaluate invented facts, missing details and source accuracy; keep audit history and a non-AI fallback.

Scale only after the clinic workflow is proven

Future platform: clinic-specific branding and domains, verified clinic onboarding, multiple doctors, staff roles, isolated records, subscription administration and operational reporting.

Future mobile: Android/iOS apps using the same core services, with suitable mobile sign-in and notification controls. The current responsive website is not a native app.

REVIEW TOGETHER

A focused first discussion

Use the demo to validate the clinic workflow, then agree the smallest useful pilot. Test credentials should be shared separately from this document.

EXPLORE THE CURRENT DEMO

Parent and doctor portals

No ChatGPT account required. Use the supplied test credentials and fictional information only.

Open the demo portal

SCAN TO OPEN

A five-minute demonstration

1 minute	Review the clinic page and parent sign-in.
2 minutes	Book a future slot for a fictional child; open it as the doctor.
2 minutes	Check in the visit, publish a sample note and view it as the parent.

Decisions requested from Dr. Ruchi

- Which three capabilities matter most for the first clinic pilot?
- What are the approved timings, fees, booking rules and follow-up process?
- Who should manage appointments and records, and what should parents be able to see?

Suggested next step

Review this demo together, record changes, then agree a written pilot scope with acceptance criteria. Effort, cost and delivery dates can be estimated once that scope is agreed.
